IN A VARIETY OF CALCIUM IONS INTO EXCITABLE CELLS AND ARE ALSO INVOLVED IN A VARIETY OF CALCIUM DEPENDENT PROCESSES, INCLUDING MUSCLE CONTRACTION, HORMONE OR NEUROTRANSMITTER RELEASE, GENE EXPRESSION, CELL MOTILITY, CELL DIVISION AND CELL DEATH. THE ISOFORM ALPHA-1A GIVES RISE TO P AND/OR Q-TYPE CALCIUM CURRENTS. P/Q-TYPE CALCIUM CHANNELS BELONG TO THE "HIGH-VOLTAGE ACTIVATED" (HVA) GROUP AND ARE BLOCKED BY THE FUNNEL TOXIN (FTX) AND BY THE OMEGA-GACOXIN-TOXIN (OMEGA-AGA-TVA). THEY ARE HOWEVER INSENSITIVE TO DIHYDROPYRIDINES (DHP), AND OMEGA-CONOTOXIN-CVIA (OMEGA-CTX-GVIA).

COMPLEXES, CONSISTING OF ALPHA-1, ALPHA-2, BETA AND DELTA SUBUNITS IN A 1:1:1:1 RATIO. THE CHANNEL ACTIVITY IS DIRECTED BY THE PORE-FORMING AND VOLTAGE-SENSITIVE ALPHA-1, SUBUNIT. IN MANY CASES, THIS SUBUNIT IS SUFFICIENT TO GENERATE VOLTAGE-SENSITIVE CALCIUM CHANNEL ACTIVITY. THE DATALLARY SUBUNITS BETA AND DELTA SUBUNITS IN ALPHA-2/DELTA LINKED BY A DISULFIDE BRIDGE REGULATE THE CHANNEL ACTIVITY.

-1. SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-1. ALTERNATIVE PRODUCTS: IN THE BRAIN, A SHORT ISOFORM BI-1/1A-1 AND A LONG ISOFORM BI-2/1A-2 (SHOWN HERE), ARE PRODUCED BY ALTERNATIVE SPECIFIC: PURKINJE CELLS CONTAIN PREDOMINANTLY P-TYPE VSCC, THE Q-TYPE BEING A PROMINENT CALCIUM CHARNEL ACTIVITY: BRAIN-SPECIFIC: PURKINJE CELLS.

-1. DOMAIN: EACH OF THE FOUR INTERNAL REPEATS CONTAINS FIVE HYDROPOHOBIC TRANSMEMBRANE SEGMENTS (S1, S2, S3, S5, S6) AND ONE PROSITIVELY CHARGED TRANSMEMBRANE SEGMENT (S4). S4 SEGMENTS PROBABLY REPRESENT THE VOLTAGE-SENSOR AND ARE CHARACTERIZED BY A SEMILES OF POSITIVEN.

-1. SIMILARITY: BELONGS TO THE CALCIUM CHANNEL ALPHA-1 SUBUNITS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA BINDING SPECIFICITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BINDING TO U1-70K.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE;
                                                                                                                                                                                                                                                                                                                                                                                                                     Specific commitment of different pre-mRNAs
                                                                                            FUNCTION: NECESSARY FOR THE SPLICING OF PRE-MRNA. IT IS REQUIRED FOR FORMATION OF THE EARLIEST ATP-DEPENDENT SPLICING COMPLEX AND INTERACTS WITH SPLICEOSOMAL COMPONENTS BOUND TO BOTH THE 5' AND 3' SPLICE SITES DURING SPLICEOSOME ASSEMBLY. IT ALSO IS REQUIRED FOR ATP-DEPENDENT INTERACTIONS OF BOTH U1 AND U2 SNRNPS WITH PRE-MRNA. INTERACTS WITH OTHER SPLICEOSOMAL COMPONENTS, VIA THE RS DOMAINS, TO FORM A BRIDGE BETWEEN THE 5' AND 3' SPLICE SITE BINDING COMPONENTS, U1 SNRNP AND U2AF. IN VITRO, BINDS SF2/ASF, U1-70K AND THE 35 KD BUT NOT THE 65 KD SUBUNIT OF U2AF. BINDS TO PURINE-RICH RNA SEQUENCES, EITHER 5'-AGSAGAGTA-3' CAN BIND TO BETA-GLOBIN MRNA AND COMMIT IT TO THE 5PLICENCE PATHWAY.
SUBCELLULAR LOCATION: NUCLEAR.
SUBCELLULAR LOCATION: NUCLEAR.
ALTERNATIVE PRODUCTS: DIFFERENT FORMS OF THE PROTEIN MAY BE PRODUCED BY ALTERNATIVE SPLICING.
PTM: EXTENSIVELY PHOSPHORYLATED ON SERINE RESIDUES IN THE RESIDUES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                94134745.

If all 1: Sep; English.

NA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate coligonucleotides as primers and cloned CDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos C 030534 and 030535 R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for toxic side-effects of known immunosuppressants such as steroids.

                                                                                                                                                                                                    New human alpha-interferon receptor protein - useful for testin interferon agonists and in treatment or diagnosis Disclosure; fig 4; 30pp; French.

This recombinant human alpha interferon (IFN) receptor protein useful for the testing of IFN agonists and for treatment and dinosis of viral diseases and tumours. Antibodles raksed against this protein can be used for blocking the receptor when require eg where overexpression of alpha-IFN is harmful. The Abs are also useful for eg drug targetting. Variants of the protein, having residues 164 (Thr) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.

The invention covers derivatives of the interferon-alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from transformed cells. Soluble deriv.s block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft rejection. See also 014239.
31-MAR-1993 (first entry)
Sequence of a soulble form of the interferon (IFN) receptor with a high affinity for IFN-alpha and -beta.
Interferon receptor; alpha-interferon; beta-interferon.

CL Alim 3; Fig 2; 58pp; English.

CL DNA encoding the water-soluble polypeptide with a high affinity for DNA encoding the water-soluble polypeptide with a high affinity for CL invalpha and -beta is isolated by PCR, using appropriate coliponarclectides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos CL invalpha and -beta receptor (Q30533), was incubated with oligos CL invalpha and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the CX is ide-effects of known immunosuppressants such as steroids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                            Compsn. of monoclonal antibodies against interferon receptor useful as immuno:modulator, eg. for treating AIDS Disclosure; Fig.3A-2B; 105pp; English.

The amino acid sequence of human interferon class I receptor is given in R73356. A recombinant soluble form of the extracellular domain of this receptor (R71723) has been used to raise immunomodulatory monoclonal antibodies.

Sequence 557 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monoclonal antibodies produced against soluble forms of the human interferon alpha-beta receptor based on the full-length human invested are casimed. The antibodies are useful for treatment and prophylaxis of disorders involving cell proliferation and/or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human IFN receptor: Interferon receptor; interferon-beta; monoclonal antibody;

C Novel splice-deleted interferon alpha-receptor (IFNAR) form 1 (W1805) is characterised by a new domain (5) which follows an end-deleted extracellular domain when compared to transmembranal (FINAR (W21804). There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd. (from human myeloma U266 cells. Soluble, non-membrane bound IFNAR (splice-deleted forms 1 and 2 (see also W21806) probably regulate the response of human cells to IFNS, either by acting as IFN (antagonists or by regulating the activity of the multiple IFN (antagonists or by regulating the activity of the multiple IFN (tissues and organisms, or for diagnostic purposes.

Novel splice-deleted interferon alpha-receptor (IFNAR) form 2 (W21806) is characterised by a double deletion when compared to transmembranal IFNAR (W21804). The extracellular domain is shortened by 6 amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a cDNA clone (see also T73521) obtd. From human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNs, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, tissues and organisms, Sc Sequence 496 AA;

Human transmembranal interferon alpha receptor (IFNAR) (W21804) includes a 21-amino acid transmembrane region. Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polypeptides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic
Claim 2; Page -; 79pp; English.

This sequence is the human CRFB4 sequence, DNA encoding it is used recombinant DNA (I) of the invention. (I) comprises a sequence (Sl) encoding the interleukin-10 (IL-10) receptor (IL10R) and a sequence

Cc Cells containing (I) may be used to identify agonists/antagonist of CC II-10. Agonists are potentially useful, e.g. for preventing allograft CC rejection, as vaccine adjuvants, for treatment of photosensitivity, CC inflammation, autoimmune disease and septic shock, while antagonists are contentially useful for increasing immune responses against tumours, Viruses, bacteria and parasites (especially intracellular pathogens) and CC for preventing organ rejection. A vector containing (I) is used to restore, e.g. by gene therapy, II-10 sensitivity to a cell that expresses a dysfunctional IIIOR and is able to bind II-10 but not to transduce a containing and intracellular pathogens, can inhibit II-10 activity in cells. Antibodies specific for CRFB4 are used to measure and localise CRBF4, for diagnosts of defective II-10 activity. CC Fragments of (I) are used as primers or probes to assay CREB4-specific CC RNA. Agonists/antagonists may be administered parenterally, orally or rectally especially by intravenous injection or directly into a tumour or callograft.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                   Novel human Zcytor? DNA encodes a type 2 cytokine receptor - useful for treating renal, neural, pancreatic and prostatic diseases Claim 1; Pages 55-59; 72pp; English.

This represents the Zcytor? cytokine receptor. Zcytor? is a ligand-binding receptor polypeptide and is a novel member of the type 2 cytokine receptor family (CRF2). An expression vector containing the Zcytor polynucleotide, operably linked to transcription promoter, a sequence encoding a transmembrane and intracellular domain, or both, and a transcriptional terminator can be used to transform host cells for the recombinant production of the polypeptide. The sequences can be used to study the Zcytor? gene and to isolate ligands binding to it. Zcytor? is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   from mouse B-cells is given in R75782. Recombinant betapref. with the transmembrane anchoring domain deleted or inactivated and with the cytoplasmic domain deleted, may may be used to treat pathological conditions associated w IFN-gamma production.
                                   also be used in the treatment of renal,
                                                  preferentially expressed in the kidney, pancreas, prostate or nervous tissue. Agonists of Zcytor7 can be used to stimulate proliferation and differentiation of cell in these organs. The antagonists and agonists

for interferon gamma, specifically induction of class I HLA
antigens, including use of AF-1 DNA in gene therapy
Disclosure; Fig 21A; 114pp; English.
The sequence is that of human interferon-gamma accessory factor-1.
Incorporation of AF-1 into immune and tumour cells re-establishes
normal function with elimination of malignant cells.
